Version

This document describes headers-more-nginx-module v0.32 released on 4 November 2016.

Synopsis

```
# set the Server output header
more_set_headers 'Server: my-server';

# set and clear output headers
location /bar {
    more_set_headers 'X-MyHeader: blah' 'X-MyHeader2: foo';
    more_set_headers -t 'text/plain text/css' 'Content-Type: text/foo';
    more_set_headers -s '400 404 500 503' -s 413 'Foo: Bar';
    more_clear_headers 'Content-Type';
```

```
        # your proxy_pass/memcached_pass/or any other config goes here...
    }

    # set output headers
    location /type {
        more_set_headers 'Content-Type: text/plain';
        # ...
    }

    # set input headers
    location /foo {
        set $my_host 'my dog';
        more_set_input_headers 'Host: $my_host';
        more_set_input_headers -t 'text/plain' 'X-Foo: bah';

        # now $host and $http_host have their new values...
        # ...
    }

    # replace input header X-Foo *only* if it already exists
    more_set_input_headers -r 'X-Foo: howdy';
```

Description

This module allows you to add, set, or clear any output or input header that you specify.

This is an enhanced version of the standard headers module because it provides more utilities like resetting or clearing "builtin headers" like `Content-Type` , `Content-Length` , and `Server` .

It also allows you to specify an optional HTTP status code criteria using the `-s` option and an optional content type criteria using the `-t` option while modifying the output headers with the more_set_headers and more_clear_headers directives. For

example,

```
more_set_headers -s 404 -t 'text/html' 'X-Foo: Bar';
```

You can also specify multiple MIME types to filter out in a single `-t` option. For example,

```
more_set_headers -t 'text/html text/plain' 'X-Foo: Bar';
```

Never use other paramemters like `charset=utf-8` in the `-t` option values; they will not work as you would expect.

Input headers can be modified as well. For example

```
location /foo {
    more_set_input_headers 'Host: foo' 'User-Agent: faked';
    # now $host, $http_host, $user_agent, and
    #   $http_user_agent all have their new values.
}
```

The option `-t` is also available in the more_set_input_headers and more_clear_input_headers directives (for request header filtering) while the `-s` option is not allowed.

Unlike the standard headers module, this module's directives will by default apply to all the status codes, including `4xx` and `5xx`.

Back to TOC

Directives

Back to TOC

more_set_headers

syntax: *more_set_headers [-t <content-type list>]... [-s <status-code list>]... <new-header>...*

default: *no*

context: *http, server, location, location if*

phase: *output-header-filter*

Replaces (if any) or adds (if not any) the specified output headers when the response status code matches the codes specified by the `-s` option *AND* the response content type matches the types specified by the `-t` option.

If either `-s` or `-t` is not specified or has an empty list value, then no match is required. Therefore, the following directive set the `Server` output header to the custom value for *any* status code and *any* content type:

```
more_set_headers    "Server: my_server";
```

Existing response headers with the same name are always overridden. If you want to add headers incrementally, use the standard add_header directive instead.

A single directive can set/add multiple output headers. For example

```
more_set_headers 'Foo: bar' 'Baz: bah';
```

Multiple occurrences of the options are allowed in a single directive. Their values will be merged together. For instance

```
    more_set_headers -s 404 -s '500 503' 'Foo: bar';
```

is equivalent to

```
    more_set_headers -s '404 500 503' 'Foo: bar';
```

The new header should be the one of the forms:

1. `Name: Value`
2. `Name:`
3. `Name`

The last two effectively clear the value of the header `Name`.

Nginx variables are allowed in header values. For example:

```
    set $my_var "dog";
    more_set_headers "Server: $my_var";
```

But variables won't work in header keys due to performance considerations.

Multiple set/clear header directives are allowed in a single location, and they're executed sequentially.

Directives inherited from an upper level scope (say, http block or server blocks) are executed before the directives in the location block.

Note that although `more_set_headers` is allowed in *location* if blocks, it is *not* allowed in the *server* if blocks, as in

```
?  # This is NOT allowed!
?  server {
?      if ($args ~ 'download') {
?          more_set_headers 'Foo: Bar';
?      }
?      ...
?  }
```

Behind the scene, use of this directive and its friend more_clear_headers will (lazily) register an ouput header filter that modifies `r->headers_out` the way you specify.

Back to TOC

more_clear_headers

syntax: *more_clear_headers [-t <content-type list>]... [-s <status-code list>]... <new-header>...*

default: *no*

context: *http, server, location, location if*

phase: *output-header-filter*

Clears the specified output headers.

In fact,

```
    more_clear_headers -s 404 -t 'text/plain' Foo Baz;
```

is exactly equivalent to

```
        more_set_headers -s 404 -t 'text/plain' "Foo: " "Baz: ";
```

or

```
        more_set_headers -s 404 -t 'text/plain' Foo Baz
```

See more_set_headers for more details.

Wildcard `*` can also be used to specify a header name pattern. For example, the following directive effectively clears *any* output headers starting by " `X-Hidden-` ":

```
    more_clear_headers 'X-Hidden-*';
```

The `*` wildcard support was first introduced in v0.09.

Back to TOC

more_set_input_headers

syntax: *more_set_input_headers [-r] [-t <content-type list>]... <new-header>...*

default: *no*

context: *http, server, location, location if*

phase: *rewrite tail*

Very much like more_set_headers except that it operates on input headers (or request headers) and it only supports the `-t`

option.

Note that using the `-t` option in this directive means filtering by the `Content-Type` *request* header, rather than the response header.

Behind the scene, use of this directive and its friend more_clear_input_headers will (lazily) register a `rewrite phase` handler that modifies `r->headers_in` the way you specify. Note that it always run at the *end* of the `rewrite` phase so that it runs *after* the standard rewrite module and works in subrequests as well.

If the `-r` option is specified, then the headers will be replaced to the new values *only if* they already exist.

Back to TOC

more_clear_input_headers

syntax: *more_clear_input_headers [-t <content-type list>]... <new-header>...*

default: *no*

context: *http, server, location, location if*

phase: *rewrite tail*

Clears the specified input headers.

In fact,

```
more_clear_input_headers -t 'text/plain' Foo Baz;
```

is exactly equivalent to

```
        more_set_input_headers -t 'text/plain' "Foo: " "Baz: ";
```

or

```
        more_set_input_headers -t 'text/plain' Foo Baz
```

To remove request headers "Foo" and "Baz" for all incoming requests regardless of the content type, we can write

```
        more_clear_input_headers "Foo" "Baz";
```

See more_set_input_headers for more details.

Back to TOC

Limitations

- Unlike the standard headers module, this module does not automatically take care of the constraint among the `Expires`, `Cache-Control`, and `Last-Modified` headers. You have to get them right yourself or use the headers module together with this module.
- You cannot remove the `Connection` response header using this module because the `Connection` response header is generated by the standard `ngx_http_header_filter_module` in the Nginx core, whose output header filter runs always *after* the filter of this module. The only way to actually remove the `Connection` header is to patch the Nginx core, that is, editing the C function `ngx_http_header_filter` in the `src/http/ngx_http_header_filter_module.c` file.

Back to TOC

Installation

Grab the nginx source code from nginx.org, for example, the version 1.11.2 (see nginx compatibility), and then build the source with this module:

```
wget 'http://nginx.org/download/nginx-1.11.2.tar.gz'
tar -xzvf nginx-1.11.2.tar.gz
cd nginx-1.11.2/

# Here we assume you would install you nginx under /opt/nginx/.
./configure --prefix=/opt/nginx \
    --add-module=/path/to/headers-more-nginx-module

make
make install
```

Download the latest version of the release tarball of this module from headers-more-nginx-module file list.

Starting from NGINX 1.9.11, you can also compile this module as a dynamic module, by using the `--add-dynamic-module=PATH` option instead of `--add-module=PATH` on the `./configure` command line above. And then you can explicitly load the module in your `nginx.conf` via the load_module directive, for example,

```
load_module /path/to/modules/ngx_http_headers_more_filter_module.so;
```

Also, this module is included and enabled by default in the OpenResty bundle.

Back to TOC

Compatibility

The following versions of Nginx should work with this module:

- **1.11.x** (last tested: 1.11.2)
- **1.10.x**
- **1.9.x** (last tested: 1.9.15)
- **1.8.x**
- **1.7.x** (last tested: 1.7.10)
- **1.6.x** (last tested: 1.6.2)
- **1.5.x** (last tested: 1.5.8)
- **1.4.x** (last tested: 1.4.4)
- **1.3.x** (last tested: 1.3.7)
- **1.2.x** (last tested: 1.2.9)
- **1.1.x** (last tested: 1.1.5)
- **1.0.x** (last tested: 1.0.11)
- **0.9.x** (last tested: 0.9.4)
- **0.8.x** (last tested: 0.8.54)
- **0.7.x >= 0.7.44** (last tested: 0.7.68)

Earlier versions of Nginx like 0.6.x and 0.5.x will *not* work.

If you find that any particular version of Nginx above 0.7.44 does not work with this module, please consider reporting a bug.

Back to TOC

Test Suite

This module comes with a Perl-driven test suite. The test cases are declarative too. Thanks to the Test::Nginx module in the Perl world.

To run it on your side:

```
$ PATH=/path/to/your/nginx-with-headers-more-module:$PATH prove -r t
```

To run the test suite with valgrind's memcheck, use the following commands:

```
$ export PATH=/path/to/your/nginx-with-headers-more-module:$PATH
$ TEST_NGINX_USE_VALGRIND=1 prove -r t
```

You need to terminate any Nginx processes before running the test suite if you have changed the Nginx server binary.

Because a single nginx server (by default, `localhost:1984`) is used across all the test scripts (`.t` files), it's meaningless to run the test suite in parallel by specifying `-jN` when invoking the `prove` utility.

Some parts of the test suite requires modules proxy, rewrite, and echo to be enabled as well when building Nginx.

Back to TOC

TODO

- Support variables in new headers' keys.
